

What is claimed is:

1. A virtual reality encounter system comprising,
a humanoid robot having tactile sensors positioned along
5 the exterior of the robot, the sensors sending tactile signals
to a communications network; and
a body suit having tactile actuators, the actuators
receiving the tactile signals from the communications network.

10 2. The system of claim 1, further comprising:
motion sensors positioned throughout the body suit, the
motion sensors sending motion signals corresponding to
movements of each sensor relative to a reference point, the
motion signals transmitted to the communications network; and
15 the humanoid robot, receiving, from the communications
network, the signals from the motion sensors, the signals from
the motion sensors causing a movement of the robot that is
correlated to a movement of the body suit.

20 3. The system of claim 2, wherein the robot includes
actuators corresponding to the motion sensors, the actuators
causing the robot to move.

25 4. The system of claim 1, wherein the robot has life-
like features, the robot comprises:
a body;
a camera coupled to the body, the camera for sending
video signals to the communications network; and
a microphone coupled to the body, the microphone for
30 sending audio signals to the communications network.

5. The system of claim 4, further comprising:

a set of goggles including a display to render the video signals received from the camera and a transducer to transduce the audio signals received from the microphone.

5

6. The system of claim 5, the robot is at a first location and the set of goggles is at a second location the system further comprising:

a second humanoid robot in the second location, the second robot having a second microphone and a second camera; and

a second set of goggles to receive the video signals from the first camera and a second earphone to receive the audio signals from the first microphone.

15

7. The system of claim 6, wherein the communications network comprises:

a first communication gateway in the first location; and
a second communication gateway in the second location,
the second processor connected to the first processor via a network.

20

8. The system of claim 5, wherein the communications network comprises an interface having one or more channels for:

25

receiving the audio signals from the microphone;
receiving the video signals from the camera;
sending the audio signals to the set of goggles; and
sending the audio signals to the transducer.

30

9. The system of claim 5, wherein the body includes an eye socket and the camera is positioned in the eye socket.

10. The system of claim 5, wherein the body includes an ear canal and the microphone is positioned within the ear canal.

11. The system of claim 10, wherein the set of goggles, comprises a receiver to receive the video signals.

12. The system of claim 5, wherein the robot comprises a transmitter to wirelessly send the audio signals, tactile signals, motion signals and the video signals to the communications network.

13. A method of having a virtual encounter, comprising:
sending tactile signals to a communications network from tactile sensors coupled to a humanoid robot, the tactile sensors positioned along the exterior of the robot; and
receiving the tactile signals from the communications network at a body suit having tactile actuators.

14. The method of claim 13, further comprising:
sending motion signals from motion sensors positioned throughout the surface of a human, the motion signals corresponding to movements of each sensor relative to a reference point, the motion signals being transmitted to a communications network;

receiving, at the humanoid robot, the motion signals sent by the motion sensors; and

causing a movement of the robot that is correlated to a movement of the human based on the motion signals received from the motion sensors.

5 15. The method of claim 14, wherein receiving comprises receiving motion signals from the motion sensors at corresponding motion actuators coupled to the robot, causing a movement comprises the motion actuators causing the robot to move.

10

16. The method of claim 14, further comprising:

sending audio signals over the communications network, the audio signals being produced from a microphone coupled to the robot;

15 sending video signals to the communications network, the video signals being produced from a camera coupled to the robot;

rendering the video signals received from the communications network using a display device embedded in a set of goggles; and

20

transducing the audio signals received from the communications network using a transducer embedded in the set of goggles.

25 17. The method of claim 16, further comprising:

sending audio signals to the communications network from a second microphone coupled to a second robot having life-like features;

sending video signals to the communications network from a second camera coupled to the second mannequin;

30

rendering the video signals received from the communications network onto a monitor coupled to a second set of goggles; and

transducing the audio signals received from the communications network using a second transducer embedded in the second set of goggles.

18. The method of claim 16, wherein the robot includes an eye socket and the camera is positioned in the eye socket.

19. The method of claim 16, wherein the robot includes an ear canal and further comprising positioning the microphone within the ear canal.

20. The method of claim 16, wherein the set of goggles, comprises a receiver to receive the video signals.

21. The method of claim 16, wherein the robot further comprises a transmitter to wirelessly send the audio signals, the motion signals, the tactile signals and the video signals to the communications network.
